THE DIVERSITY OF OUR MICRO-PRECISION TOOLS

Our diversity in micro-precision tools ranges from micro-precision drills $\varnothing$ 0.05 mm to special solutions in larger dimensions and from HSS to solid carbide. The micro-precision tool range covers 75 types in excess of 2,400 dimensions and therefore provides ex-stock tooling solutions for many applications.

Micro-precision **drilling tools**

MICRO-PRECISION DRILLING TOOLS

Micro-precision machining is continually gaining in importance in industries from mechanical to electronic engineering. Drilling operations are a central part. The smaller the components the higher the demands on precision become. Repeatable accuracy and economic efficiency of the process.

from page 30

Solid carbide micro-precision drills

Guhring's solid carbide micro-precision drills without coolant ducts cover the diameter range from 0.1 mm to 3.00 mm. With stable machining conditions and powerful machines solid carbide micro-precision drills can achieve extremely good cutting parameters and long tool life. The application of ultra fine carbide displaying a very high hardness and heat resistance as well as extreme wear resistance enables the enormous performance capability of solid carbide micro-precision drills.

- for stable machining conditions
- increased cutting parameters and tool life

Application example:

Series production on rotary transfer machine

Material: heat-treatable steel 42CrMo4
with external cooling 10% soluble oil

d = 1.2 mm
v_c = 65 m/min
n = 17,242 rev./min
f_n = 0.06 mm/rev.
v_f = 1,035 mm/min

from page 33

HSS-E-PM micro-precision drills

Guhring's micro-precision drills in high-performance powder metallurgical HSS-E steel excel thanks to very high wear resistance and high toughness as well as cutting edge stability which is especially important for unstable machining conditions.

The powder metallurgical manufactured HSS-E steel has a very homogeneous structure that has a positive effect on the consistently high-performance of the micro-precision drills.

- process reliable under unstable machining conditions
- wear resistant HSS-E-PM and high cutting edge stability

Application example:

Series production on multi-spindle machines

Material: stainless steel 1.4301
external cooling with 15% soluble oil

d = 2.0 mm
v_c = 15 m/min
n = 2,387 rev./min
f_n = 0.03 mm/rev.
v_f = 71.61 mm/min

from page 17

Solid carbide ExclusiveLine micro-precision drills also with internal cooling

Solid carbide ExclusiveLine micro-precision drills, with or without IC, enable high-performance machining of most materials, with stable machine conditions and powerful machines they really come into their own in terms of performance capability. The 2-facet point grind per cutting edge with ground cutting edge honing allows high cutting values and an optimal chip fracture.

- ▶ with stable machine conditions and powerful machines, i.e. in series production of large batch sizes
- ▶ high-performance machining, especially in stainless steels and special alloys

Application example 1: Series production

Material: alloyed case hardened steel 16MnCr5
internal cooling with 8% soluble oil

d = 2.5 mm
 $v_c = 120$ m/min
 $n = 15,279$ rev./min
 $f_n = 0.14$ mm/rev.
 $v_f = 2,139.06$ mm/min

Application example 2: Series production

Material: stainless steel X6CrNiTi18 10
internal cooling with 12% soluble oil

d = 2.1 mm
 $v_c = 60$ m/min
 $n = 9,095$ rev./min
 $f_n = 0.03$ mm/rev.
 $v_f = 273$ mm/min

MICRO-PRECISION DRILL TYPES

Advantages and fields of application

Guhring provides the optimal solution for the series production of large batch sizes on high-performance machines and with internal cooling as well as for machining tasks involving smaller batch sizes or limited machine performance and difficult machining conditions.

Scope of programme

Guhring's comprehensive micro-precision range of solid carbide and HSS-E-PM micro-precision drills covers the total diameter range from 0.05 mm to 3.0 mm.

Guhring's micro-precision range of solid carbide and powder metallurgical high speed steel (HSS-E-PM) is optimally suited for the production of very small holes in all fields of application. The production of highly-accurate very small holes requires maximum quality and is one of the most demanding drilling operations.

With Guhring's comprehensive standard range the optimal micro-precision drill is available for every user for such occasions. As well as the standard micro-precision drills listed Guhring also provides special solutions for HSS-E-PM micro-precision drills as well as for solid carbide micro-precision drills on customer request.

*The feed rates always relate to tools with the recommended coating. In some cases the successful application of un-coated tools cannot be guaranteed.

All deep hole drills must have support for the pilot hole.
Deep hole drills must never operate at full speed without support in the machine shop.

Application advice

- For drilling depths in excess than 40 x D we recommend the use of two or more gun drills, e. g. Ø 10 x 400 mm and Ø 9.95 x 800 mm.
- Gun drills for drilling depths of more than 40 x D should enter the pilot hole revolving in the left hand direction.
- When changing tools for drilling depths of more than 40 x D, the tool can be damped by switching on coolant supply for just one second.
- For machining of long-chipping materials we recommend the use of gun drills with polished flutes.
- Generally we recommend the use of soluble oil with a minimum oil content of 10 %.
- Single-fluted gun drills for long-chipping aluminium should be supplied with point grind 180° and coolant chamber.
- When spotting in aluminium with an Si-content of less than 1%, i.e. with recommended cutting rates $v_c > 160$ m/min we recommend to advance to the final speed in several steps. In addition, a deeper pilot hole of approximately 3 x D should be produced.

The sequence of operations for deep hole drilling

- production of pilot hole ($L = 1.5 \times D$, tolerance G9)
- enter at low revolutions, approx. 200 rev./min, feed rate approx. 500 mm/min. With tools for drilling depths in excess than 40 x D enter the pilot hole revolving in left hand direction.
- setting of coolant pressure and revolutions
- uninterrupted drilling to required drilling depth without wood pecking. When applying gun drills with increased length-diameter-ratio, we recommend machining with reduced cutting parameters (approx. 75% of the optimal cutting speed) up to a drilling depth of approx. 25 mm.
- switching off coolant supply after reaching the required hole depth
- withdrawal in top gear with stationary spindle

Material dependent coolants

- air
- neat oil
- soluble oil

Procedure

In order to achieve optimal machining results when producing deep holes, especially when spotting on radii or uneven surface, we recommend the following operating steps.

1. Milling a surface, i.e. with Guhring's Ratio end mill RF 100 U incl. centre cutting. The surface must be at right angles to the entrance angle of the drilling operation.
2. Production of a cylindrical pilot hole (tolerance G9) with a drilling depth of minimum 1 x D. For this we recommend our Ratio drill RT 100 U or RT 100 F. Thanks to their point angle of 140° and their Ø-tolerance m7 these Ratio drills are optimally suited for this operating step.
3. Entering the pilot hole at a speed of approximately 300 rev./min and a feed rate of approximately 500 mm/min.
4. Adjusting the cooling lubricant pressure and speed.
5. Continuous drilling to full drilling depth without pecking cycle.
6. With through holes with straight, i.e. 90°, exit, reduce feed rate by 50% approximately 1 mm before to break through.
7. With through holes with oblique exit reduce the feed rate v_f to 40% approximately 1 mm before to break through.
8. After achieving the drilling depth switch off speed and cooling lubricant. Withdraw at rapid traverse.

Ratio end mill type RF 100 U, article no. 3736

Thanks to its unequal helix Guhring's FIRE-coated Ratio end mill RF 100 U offers maximum feed rates and tool life for finishing and roughing operations in steel and cast materials as well as Ti- and Ni-alloys.

Ratio drill RT 100 U, article no. 2477

Ratio drill RT 100 F, article no. 1660

Guhring's Ratio drills excel with very good self-centering characteristics and alignment accurate holes thanks to their special cutting edge geometry. Type U is especially suitable for the machining of general steels and high-alloyed AISi-alloys, type F for high-alloyed, stainless, acid and heat resistant steels, Al and Al-alloys, Mg and Mg-alloys as well as Ti and Ti-alloys.

Micro-precision **threading tools**

MICRO-PRECISION THREADING TOOLS

Tools for the production of threads have the same critical task in common: They are applied at the end of the production chain when components and individual parts are practically finished. Therefore, the production of threads is an especially delicate operation. If the tool is incorrectly applied or operates unreliably the workpiece can be damaged or even unusable. For the production of micro-precision threads there are several procedures leading to the required result.

from page 74

Micro-precision thread milling cutters

Guhring's micro-precision thread milling cutters are suitable for right-hand as well as left-hand threads and allow the production of different thread tolerances with only one tool. Thanks to the low cutting pressure the thread milling cutters are optimally suitable for high tensile materials such as for example VA steels, Inconel or titanium. Hard machining up to HRC 65 is possible. In these machining areas micro-precision thread milling cutters promise absolute process reliability and high productivity.

- ▶ different thread tolerances with only one tool
- ▶ for the machining of special alloys and up to HRC 65

Application example:

Fastening thread insert seat

Material: 1.2343 (43 HRC)

Dimension: M2,5

$v_c = 45 \text{ m/min}$

$f_z = 0.02 \text{ mm}$

from page 77

Taps for ISO metric threads

The combination of cutting ability and special coating distinguish Guhring's taps in micro-precision machining. Relief geometry and rake angle were specially adapted for micro-precision machining. In this field the application is possible in a broad material spectrum, including structural steel, high-tensile steel as well as stainless steel.

- ▶ extreme cutting ability thanks to adapted geometry
- ▶ applicable in a broad material spectrum

Application example:

Tapping in stainless steel

Material: 1.4571

Dimension: M3

$v_c = 8 \text{ m/min}$

from page 79

Fluteless taps

Guhring's micro-precision fluteless taps were raised to the next level with regard to their polygon shape. By modifying the geometry the contact surface between tool and functional area was optimised. Torque was subsequently reduced by up to 30 percent.

- up to 30 % less torque
- reduced axial forces

Application example:
Fluteless tapping in titanium
Material: TiAl6V4
Dimension: M2,5
 $v_c = 6 \text{ m/min}$

Micro-precision **milling tools**

MICRO-PRECISION MILLING TOOLS

With milling operations using a small tool diameter the deflection of the tool is a considerable problem. The high demands of micro-precision machining require the prevention or reduction of dimensional deviations caused by tool deflection. For this, it is necessary the micro-precision milling tools are especially fast cutting and sharp. High carbide quality, close tolerances and ensuring process reliable cooling are absolutely essential already from the blank stage.

from page 94

End mills

End mills (with straight face) in the micro-precision range are available as universal tools with $z = 2, 3$ or 4 in the dimensions 0.3 to 8 mm. The pilot end mill is applied for spotting uneven surfaces and cavities and ensures an accurate hole. Materials up to 55 HRC can be process reliably machined.

- slot drills and pilot end mills in different designs
- universal micro-precision milling up to 55 HRC

Application example:

Slotting in 1.4301 (wet machining)
Micro-precision slot drill article no.: 3684 0.6 mm

$a_p = 0.1$ mm
 $a_e = 0.6$ mm
 $v_c = 60$ m/min $S = 32,000$ min⁻¹
 $v_f = 800$ mm/min $f_z = 0.006$ mm

from page 89

Profile cutters

The profile cutter range includes ball nose and corner radius cutters for the machining of heat treatable and stainless steels, high-tensile aluminium and titanium as well as for the machining of hardened steels, chilled cast iron and wear materials.

Micro-precision profile cutters guarantee accurate diameter tolerances and close radius tolerances in precision mould making. The cylinder and radius areas are ground in a one pass process for optimal wear protection, the radius grind with constant helix correction ensures further process reliability. Finest surface finishes are made possible through homogenised cutting edges and contribute to further increasing tool life

- seamless radius area
- with SIGNUM-coating

Application example:

Profile cutting in 1.2083 HRC 54 (dry machining),
HSC profile cutter GF 500 Guhring no.: 3856 2.0 mm

$a_p = 0.05$ mm
 $a_e = 0.2$ mm
 $v_c = 110$ m/min $S = 17,500$ min⁻¹
 $v_f = 700$ mm/min $f_z = 0.02$ mm

from page 98

Chamfering milling cutters

Micro-precision chamfering milling cutters are universally suitable for chamfering, forward and backward de-burring and for contour operations in most materials. The lead chamfer of established chamfer tools was optimised for the Guhring micro-precision range. Low cutting pressure ensures an especially soft cut with little wear. The 90° forward and backward de-burring tool enables the chamfering of the upper and lower edge without re-clamping the workpiece. The cutting ability of the tools extends to the smallest diameter – to nearly 0.

- facet relief grind
- no secondary burr

Application example:

Chamfer milling in 1.4571 (wet machining)
90° chamfering milling cutter Guhring no.: 6713 4.0 mm

$a_p = 0.2 \text{ mm}$
 $a_e = 0.2 \text{ mm}$
 $v_c = 130 \text{ m/min}$ $S = 13,750 \text{ min}^{-1}$
 $v_f = 1.650 \text{ mm/min}$ $f_z = 0.03 \text{ mm}$

available as special tool

ExclusiveLine

Micro-precision milling cutters of the ExclusiveLine are available in the lengths 3, 5, 8, 10, 12 x D as well in designs with flute numbers $z = 2$ and $z = 3$. The $z = 3$ design also possesses a 45° helix angle for a low-vibration operation. The face geometry was specially re-developed and re-designed for the micro-precision milling cutter range. The specifically produced carbide meets the especially high demands on hardness and was therefore selected especially fine grain. New is also peripheral cooling with 4 or 6 coolant ducts – also made possible thanks to Guhring's own carbide production. The combination of radius and transition angle achieves maximum rigidity with corresponding effective length.

- 3 different face, 5 different length ratio options
- smallest diameter and radius tolerances (+/- 5 μm)

Application example:

Copy milling in 1.2379 HRC 58 (dry machining),
ExclusiveLine profile cutter 1.0 mm

$a_p = 0.05 \text{ mm}$
 $a_e = 0.05 \text{ mm}$
 $v_c = 120 \text{ m/min}$ $S = 38,200 \text{ min}^{-1}$
 $v_f = 610 \text{ mm/min}$ $f_z = 0.008 \text{ mm}$

3-fluted

In addition to our successful mini slot drills we are extending the range of ExclusiveLine micro precision milling cutters with universal 3-fluted milling cutters with 45° helix for slotting, roughing and finishing in most materials:

- all plastics such as POM, PE, PVC, PEEK, PMMA or similar
- aluminium and non-ferrous metals as well as precious metals
- soft and tough steels up to high-tensile steels up to 48 HRC
- stainless and acid resistant materials and special alloys such as titanium, cobalt-chrome and Inconel

Innovative coolant duct design

|GÜHROJET|

A specially designed ultra-hard finest grain carbide was applied for ExclusiveLine micro-precision milling cutters – made possible by Guhring's in-house carbide development. Dependent on tool diameter four to six peripheral coolant ducts guarantee a perfect chip evacuation via air, MQL or high-pressure internal cooling even with deep slots or pockets.

Switching on GuhroJet internal cooling

Internal cooling with 80 bar with S=0 rev./min

Internal cooling with 80 bar with S=24,000 rev./min

Radius accuracy of our ball nose and corner radius ExclusiveLine micro-precision milling cutters:

Accuracy tool classes:

Guhring’s radius tools offer the following accuracy classes in diameter and radius tolerances to ensure the required component precision.

	Tool type	Tool accuracy
	Ball nose end mill 2- and 4-fluted	Diameter: h10 Radius tolerance: +/- 0.05 mm
	GF 300 / GF 500 HSC profile cutter	Diameter: h8 Radius tolerance: +/- 0.01 mm
	Micro-precision milling cutters	Diameter: +/- 0.005 mm Radius tolerance: +/- 0.005 mm

Micro-precision **reaming** tools

MICRO-PRECISION REAMING TOOLS

The already extreme demands on surface finish quality and tolerance are raised to a further level in the area of micro-precision reaming. As long as the reamer was suitably ground and the other operating conditions satisfy the high requirements, these demands can also be met for micro-precision reaming. Key factors include Guhring's own carbide adapted to meet the demands of reaming operations as well as concentricity and process reliability.

from page 106

HR 500

The blind hole option possesses a central coolant bore. The through hole option possesses four off-centre coolant bores safely guiding the chip to the front. Thus the solid carbide high-performance reamer HR 500 also achieves outstanding cutting values and high hole qualities in the micro-precision range. As the sole standard reamer with internal cooling from Ø 1.97 mm it enables higher cutting values and considerably longer tool life in comparison to the other reamers.

- high cutting values and process reliability
- universal application
- suitable for hard machining up to approximately 63 HRC

Application example:

16MnCr5, Ø = 2.0 H7

$v_c = 150 \text{ m/min}$

$f_u = 0.25 \text{ mm/rev.}$

Tool life: 33 m

page 110, 112, 113

Solid carbide NC machine reamers

NC reamers similar to DIN 8093 with straight shank (h6) especially for standard clamping in hydraulic or shrink fit chucks. High concentricity and process reliability for the production of fits.

- universal application
(steel, aluminium, non-ferrous metals up to 52 HRC)
- NC shank design to DIN 6535 HA (h6)

Application example:

42CrMo4, Ø = 2.5 ± 0,01

$v_c = 12 \text{ m/min}$

$f_u = 0.08 \text{ mm/rev.}$

Tool life: 12 m

page 111, 114

HSS-E machine reamers

Micro-precision reamers with h9 shank are predominantly suitable for single component and small series production. High concentricity and process reliability for universal application.

- for small series and single component manufacture
- tol. h9

from page 118

Deburring forks

Micro-precision deburring forks mechanically de-burr in one clamping set up. Valuable setting-up times and costs are saved. The operating principle of the deburring tool is based on the carbide's tension, thus the deburring fork does not require any moving mechanical components that as source of error may influence the process reliability.

- for de-burring hole entry and exit in one step
- manual re-working unnecessary

ISO code

P	Steel, high-alloyed steel
M	Stainless steel Stainless
K	Grey cast iron, spher, graphite/mall. cast iron
N	Aluminium and other non-ferrous metals
S	Special, super and titanium alloys
H	Hardened steel and chilled cast iron

On the following price and programme pages you will find for every tool recommendations regarding suitability for the application groups and details of max. tensile strength and hardness:

- optimal suitability
- limited suitability
